

# **AN ELECTRICAL CONNECTOR FOR OPEN/CLOSE TYPE**

## **ABSTRACT OF THE DISCLOSURE**

An electrical connector for open/close type includes a base member, at least a terminal member to setup on the base member and a cover member to fit on top of base member. An interlock member connects the cover member with the base member. The electrical connector allows the cover member to be opened and closed corresponding to the body member. Besides, a receiving space is formed between the cover member and with the base member receiving a plug of the jack module. The cover keeps parallel to the base member in order to reduce the thickness of the electrical connector.
